| QUESTION 1: How many observations are in this dataset? - 569 | 95 |
| QUESTION 2: How many of the observations have a malignant diagnosis? - 212 . . | 96 |
| QUESTION 3: How many variables/features in the data are suffixed with __mean? - 10 | 96 |
| Check column means and standard deviations | 96 |
| QUESTION 4: From your results, what proportion of the original variance is captured by the first principal components (PC1)? | 98 |
| QUESTION 5: How many principal components (PCs) are required to describe at least 70% of the original variance in the data? | 98 |
| QUESTION 6: How many principal components (PCs) are required to describe at least 90% of the original variance in the data? | 98 |
| QUESTION 7: What stands out to you about this plot? Is it easy or difficult to understand? Why? | 98 |
| QUESTION 8: Generate a similar plot for principal components 1 and 3. What do you notice about these plots? | 100 |
| QUESTION 9: For the first principal component, what is the component of the loading vector (i.e. wisc.pr\$rotation[,1]) for the feature concave.points__mean? This tells us how much this original feature contributes to the first PC. | 104 |
| QUESTION 10: Using the plot() and abline() functions, what is the height at which the clustering model has 4 clusters? | 105 |
| QUESTION 12: Which method gives your favorite results for the same data.dist dataset? Explain your reasoning. | 108 |
| QUESTION 13: How well does the newly created model with four clusters separate out the two diagnoses? | 112 |

| | |
|---|-----|
| QUESTION 14 How well do the hierarchical clustering models you created in previous sections (i.e. before PCA) do in terms of separating the diagnoses? Again, use the table() function to compare the output of each model (wisc.km\$cluster and wisc.hclust.clusters) with the vector containing the actual diagnoses. | 112 |
| QUESTION 16 Which of these new patients should we prioritize for follow up based on your results? | 113 |

Background

The goal of this mini-project is for you to explore a complete analysis using the unsupervised learning techniques covered in the last class. You'll extend what we learned by combining PCA as a pre-processing step to clustering using data that consist of measurements of cell nuclei of human breast masses. This expands on our RNA-Seq analysis from last day.

The data itself comes from the Wisconsin Breast Cancer Diagnostic Data Set first reported by K. P. Benne and O. L. Mangasarian: "Robust Linear Programming Discrimination of Two Linearly Inseparable Sets".

Values in this data set describe characteristics of the cell nuclei present in digitized images of a fine needle aspiration (FNA) of a breast mass.

Data Import

The data is available as a CSV from the class website:

```
read.csv("WisconsinCancer.csv")

QUESTION 4: From your results, what proportion of the original variance is captured by the first principal components (PC1)?

44.27%

QUESTION 5: How many principal components (PCs) are required to describe at least 70% of the original variance in the data?

3 principal components

QUESTION 6: How many principal components (PCs) are required to describe at least 90% of the original variance in the data?

7 principal components

QUESTION 7: What stands out to you about this plot? Is it easy or difficult to understand? Why?

This plot (biplot) is incredibly difficult to understand as it just shows a huge blob/cluster that is difficult to interpret. The whole point of the PCA plot is to visualize the trend of observations and variables and the graph before me is very difficult to interpret.

QUESTION 8: Generate a similar plot for principal components 1 and 3. What do you notice about these plots?

PC1 vs. PC2 plot shows a wider overview of separation and a view of the two benign and malignant clusters while PC1 vs. PC3 plot shows subtle changes in the spread of clusters.

```
ggplot(wisc.pr.df, aes(x = PC1, y = PC3, color = diagnosis)) +
  geom_point(size = 3, alpha = 0.9) +

    y = "Principal Component 3",

QUESTION 9: For the first principal component, what is the component of the loading vector (i.e. `wisc.pr$rotation[,1]`) for the feature `concave.points_mean`? This tells us how much this original feature contributes to the first PC.

```
# Loading (weight) of concave.points_mean on the first principal component
wisc.pr$rotation["concave.points_mean", 1]
```

```
[1] -0.2608538
```

-0.2608538 means that when `concave.points_mean` increases, the value of PC1 tends to decrease. Higher `concave.points_mean` values is associated with malignant samples because malignant samples have more irregular concave borders.

```
# Scale the wisc.data data using the "scale()" function

```
# Perform hierarchical clustering using complete linkage
wisc.hclust <- hclust(data.dist, method = "complete")

QUESTION 10: Using the `plot()` and `abline()` functions, what is the height at which the clustering model has 4 clusters?

```

QUESTION 12: Which method gives your favorite results for the same data.dist dataset? Explain your reasoning.

The method that gave me my favorite results was the ward.D2 method because it merges clusters to minimize the increase in total within-cluster variance. I like being able to visualize more compact, similarly-sized clusters.

QUESTION 13 How well does the newly created model with four clusters separate out the two diagnoses?

Separates them very well, there isn't a huge overlap between the two clusters.

```
# Compare to actual diagnoses

QUESTION 14 How well do the hierarchical clustering models you created in previous sections (i.e. before PCA) do in terms of separating the diagnoses? Again, use the `table()` function to compare the output of each model (`wisc.km$cluster` and `wisc.hclust.clusters`) with the vector containing the actual diagnoses.

```
# Compare hierarchical clustering (before PCA) to diagnosis

QUESTION 16 Which of these new patients should we prioritize for follow up based on your results?

We should prioritize the malignant group because it is more varied in their tumor cells.
