

# Class05: Data Viz with GGPLOT

Parnaz Boroon (PID:A13557370)

Today we are playing with plotting and graphing in R.

There are lots of ways to make cool figures in R. There is “base” R graphics (‘plot()’, ‘hist()’, ‘boxplot()’, etc.)

There is also add-on packages, like **ggplot**.

```
head(cars,3)
```

	speed	dist
1	4	2
2	4	10
3	7	4

Let's plot this with “base” R:

```
plot(cars)
```

```
head(mtcars)
```

	mpg	cyl	disp	hp	drat	wt	qsec	vs	am	gear	carb
Mazda RX4	21.0	6	160	110	3.90	2.620	16.46	0	1	4	4
Mazda RX4 Wag	21.0	6	160	110	3.90	2.875	17.02	0	1	4	4
Datsun 710	22.8	4	108	93	3.85	2.320	18.61	1	1	4	1
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3	1
Hornet Sportabout	18.7	8	360	175	3.15	3.440	17.02	0	0	3	2
Valiant	18.1	6	225	105	2.76	3.460	20.22	1	0	3	1

Let's plot 'mpg' vs. 'disp'

```
plot(mtcars$mpg,mtcars$disp, pch=8)
```

```
hist(mtcars$mpg)
```

## GGPLOT

The main function in the `ggplot2` package is `ggplot()`. First I need to install the **ggplot2** package. I can install any package with the function `install.packages()`. You don't want to keep downloading `ggplot` over and over again. *In order to not download the software package over and over again, type this code in the console.*

**N.B.** I never want to run `install.packages()` in my quarto source document girl!

```
library(ggplot2)
ggplot(cars) +
  aes(x=speed, y=dist)+
  geom_point()
```

```
ggplot(cars)+
  aes(speed)+
  geom_histogram()
```

``stat_bin()`` using ``bins = 30``. Pick better value ``binwidth``.

Every ggplot needs at least 3 things:

- The **data** (given with 'ggplot(cars)')
- The **aesthetics** mapping (given with 'aes()')
- The **geometry** (given with geom\_point)

For simple canned graphs “base” R is nearly always faster

### Adding more layers

Let's add a line and a title, subtitle and caption as well as custom axis labels.

```
library(ggplot2)
ggplot(cars) +
  aes(x=speed, y=dist)+
  geom_point() +
  geom_line ()
```

```
library(ggplot2)
ggplot(cars) +
  aes(x=speed, y=dist)+
  geom_point() +
  geom_smooth ()
```

`geom\_smooth()` using method = 'loess' and formula = 'y ~ x'

```
library(ggplot2)
ggplot(cars) +
  aes(x=speed, y=dist)+
  geom_point() +
  geom_smooth (method="lm", se=FALSE)
```

`geom\_smooth()` using formula = 'y ~ x'

```
library(ggplot2)
ggplot(cars) +
  aes(x=speed, y=dist)+
  geom_point() +
  geom_smooth(method="lm", se=FALSE) +
  labs (
    title= "Parnaz's Silly Plot",
    subtitle = "This is my practice plot.",
    x="Speed(MPH)",
    y="Distance (ft)")+
  theme_bw()
```

`geom\_smooth()` using formula = 'y ~ x'

## Parnaz's Silly Plot

This is my practice plot.

```
##Plot some expression data
```

Read data file from online URL

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)
```

	Gene	Condition1	Condition2	State
1	A4GNT	-3.6808610	-3.4401355	unchanging
2	AAAS	4.5479580	4.3864126	unchanging
3	AASDH	3.7190695	3.4787276	unchanging
4	AATF	5.0784720	5.0151916	unchanging
5	AATK	0.4711421	0.5598642	unchanging
6	AB015752.4	-3.6808610	-3.5921390	unchanging

Q1. How many genes are in this wee dataset?

There are 5196 in this dataset.

Q2. How many “up” regulated genes are there?

```
sum(genes$State == "up")
```

```
[1] 127
```

These are 127 genes.

```
table(genes$State)
```

down	unchanging	up
72	4997	127

```
ggplot(genes)+  
  aes(x=Condition1, y=Condition2, col=State)+  
  geom_point()+  
  scale_colour_manual( values=c("blue","gray","red") )+  
  labs (  
    title= "Gene Expression Changes Upon Drug Treatment",  
    x="Control(no drug)",  
    y="Drug Treatment")
```

Silly example of adding labels

```
library(ggrepel)

ggplot(genes)+
  aes(x=Condition1, y=Condition2, col=State,label=Gene)+
  geom_point()+
  scale_colour_manual( values=c("blue","gray","red") )+
  labs (
    title= "Gene Expression Changes Upon Drug Treatment",
    x="Control(no drug)",
    y="Drug Treatment")+
  geom_text_repel(max.overlaps = 100)
```

Warning: ggrepel: 5183 unlabeled data points (too many overlaps). Consider increasing max.overlaps

## Going Further

Playing with some different layers and the gapminder dataset...

```
# File location online
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder.tsv"

gapminder <- read.delim(url)
```

```
head(gapminder)
```

	country	continent	year	lifeExp	pop	gdpPercap
1	Afghanistan	Asia	1952	28.801	8425333	779.4453
2	Afghanistan	Asia	1957	30.332	9240934	820.8530
3	Afghanistan	Asia	1962	31.997	10267083	853.1007
4	Afghanistan	Asia	1967	34.020	11537966	836.1971
5	Afghanistan	Asia	1972	36.088	13079460	739.9811
6	Afghanistan	Asia	1977	38.438	14880372	786.1134

```
tail(gapminder)
```

	country	continent	year	lifeExp	pop	gdpPercap
1699	Zimbabwe	Africa	1982	60.363	7636524	788.8550
1700	Zimbabwe	Africa	1987	62.351	9216418	706.1573
1701	Zimbabwe	Africa	1992	60.377	10704340	693.4208
1702	Zimbabwe	Africa	1997	46.809	11404948	792.4500
1703	Zimbabwe	Africa	2002	39.989	11926563	672.0386
1704	Zimbabwe	Africa	2007	43.487	12311143	469.7093

```
ggplot(gapminder) +
  aes(x=gdpPercap, y=lifeExp, col=continent) +
  geom_point()+
  facet_wrap(~continent)
```

Insert fun plot here:

```
ggplot(gapminder) +
  aes(x = gdpPercap, y = lifeExp,
      col = continent,
      size = pop) + # bubble size reflects population
  geom_point(alpha = 0.7) +
  facet_wrap(~continent) +
  scale_size(range = c(1, 8)) + # keep bubbles readable
  labs(size = "Population (log-scaled)") +
  theme_minimal()
```
